XLVII, pp. 1-6, has been the starting point for many investigations in the theory of polar curves and envelopes. His theorems, stated without proof, are given with reference to the general curve of order n. Salmon in Higher Plane Curves, gives a resume of Steiner s theorems with reference to the general curve, and a more specific discussion of the cubic. He uses a method partly analytic and partly geometric. The most complete treatment of the subject of poles and polars is that of Cremona in his Introduction to the Study of Plane Curves, published in 1865. He bases the theory entirely upon the properties of loci of harmonic means; and his purpose, stated in the preface, is to give a satisfactory geometrical proof of the theorems enunciated by Steiner and other writers on the subject. These three, Salmon, Cremona, and Steiner, have considered the question of poles and polars from the standpoint of the general curve of order n, and with important articles by Clebsch and others, to which references will be made later, constitute the chief sources for the general theory of polar curves. Steiner in general considers such points as the envelope of first polar curves of points on a given locus. In case the directrix is a right line, the envelope, by his formula, reduces to order zero. Cremona studies them from the standpoint of base points of...
